

FASHION.AI

SIMILARITY &
COMPATIBILITY SEARCH
FOR USERS

Kavisara
Jantarakolica

Agenda

BACKGROUND

These days, many people have **2 main problems** when we talk about clothing.

1.) They find clothes they like, but they don't know where to buy them.

2.) They want to dress better, but they struggle with matching their clothing properly.

OUR SOLUTION

Fashion Platform (personal stylist) that can help users by

1.) Find similar clothing items for users

2.) Suggest compatible fashion items for users

input image from user

output image from platform

input image from user

output image from platform

TARGET CUSTOMER

**Men & Women (Gen Z)
18-35 years**

who love modern classic style clothing

People do not want to waste their
time to find fashion product to buy

People do not know how to match
their outfit on everyday look

OBJECTIVES

The compatibility score
based on the suggested
item generated by model
should be **more than**

> 0.5
out of 1

The similarity score
based on the suggested
item generated by model
should be **more than**

> 0.5
out of 1

**The average score of 7
suggested outfit sets**
from the compatibility
model that evaluate by
sample group and fashion
expert should be **more
than**

> 4
out of 5

308K outfits
672K items

detailed annotation
for each data item

- categories
- Japanese website

Examples of
uploaded outfit in
iqon.jp

TRAINING DATASET

IQON3000

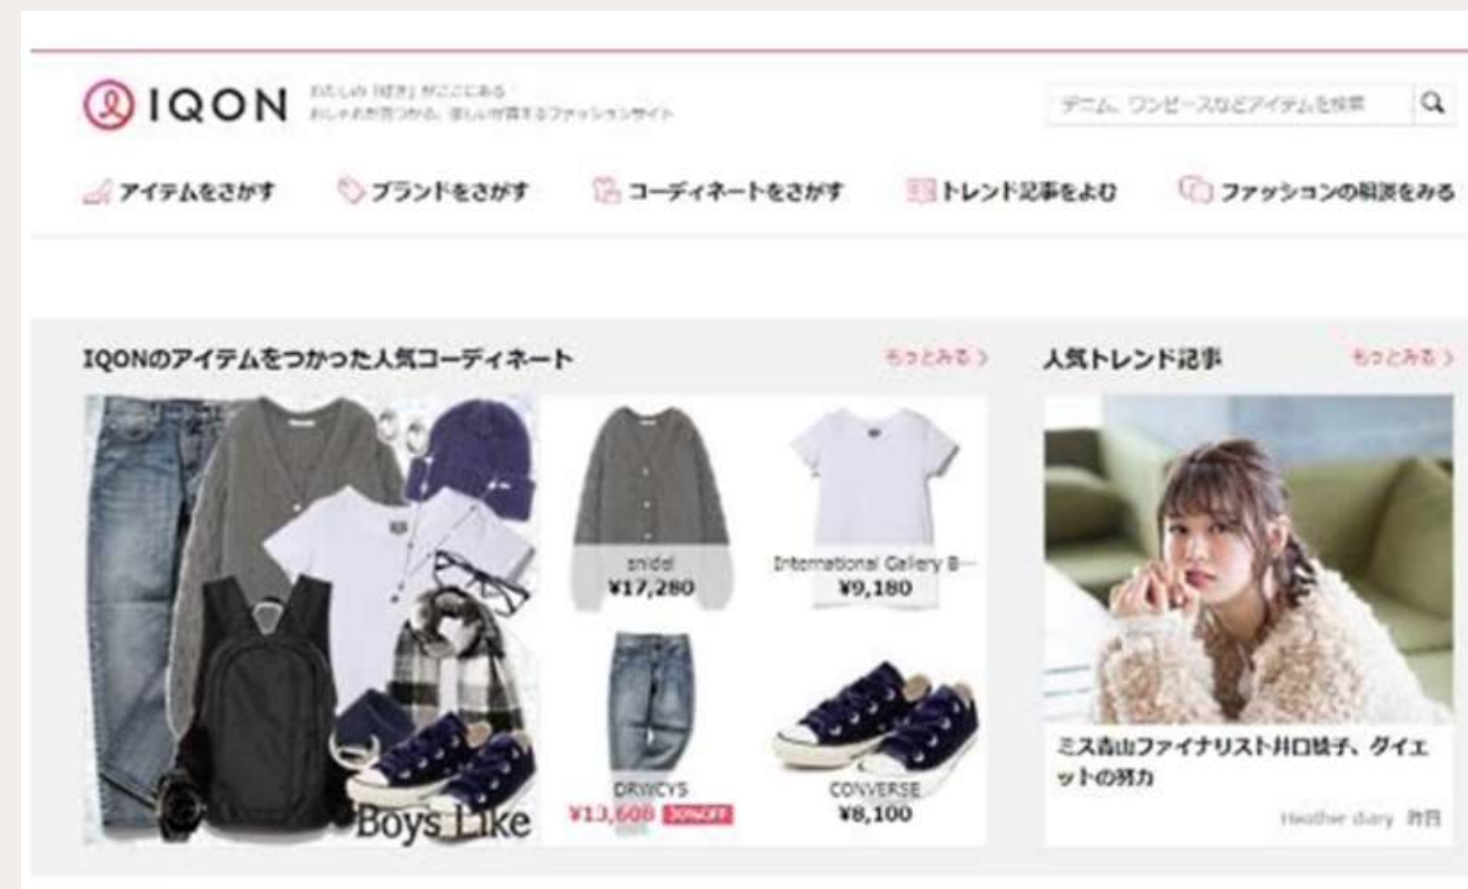

1. From 62 categories in dataset

2. Prioritize the categories that fitted into the tops and bottoms

3. Kept only outfits with at least one top and one bottom, resulting in

192,857 outfits

in training dataset

TRAINING DATASET

IQON3000

Incomplete outfit

A complete outfit contains at least

tops = ['ブラウス','チュニック','トップス','Tシャツ','タンクトップ','カーディガン','ニット']

bottoms = ['ショートパンツ','ロングパンツ','スカート','ロングスカート','レッグウェア']

TESTING DATASET

scraped dataset
100 outfits

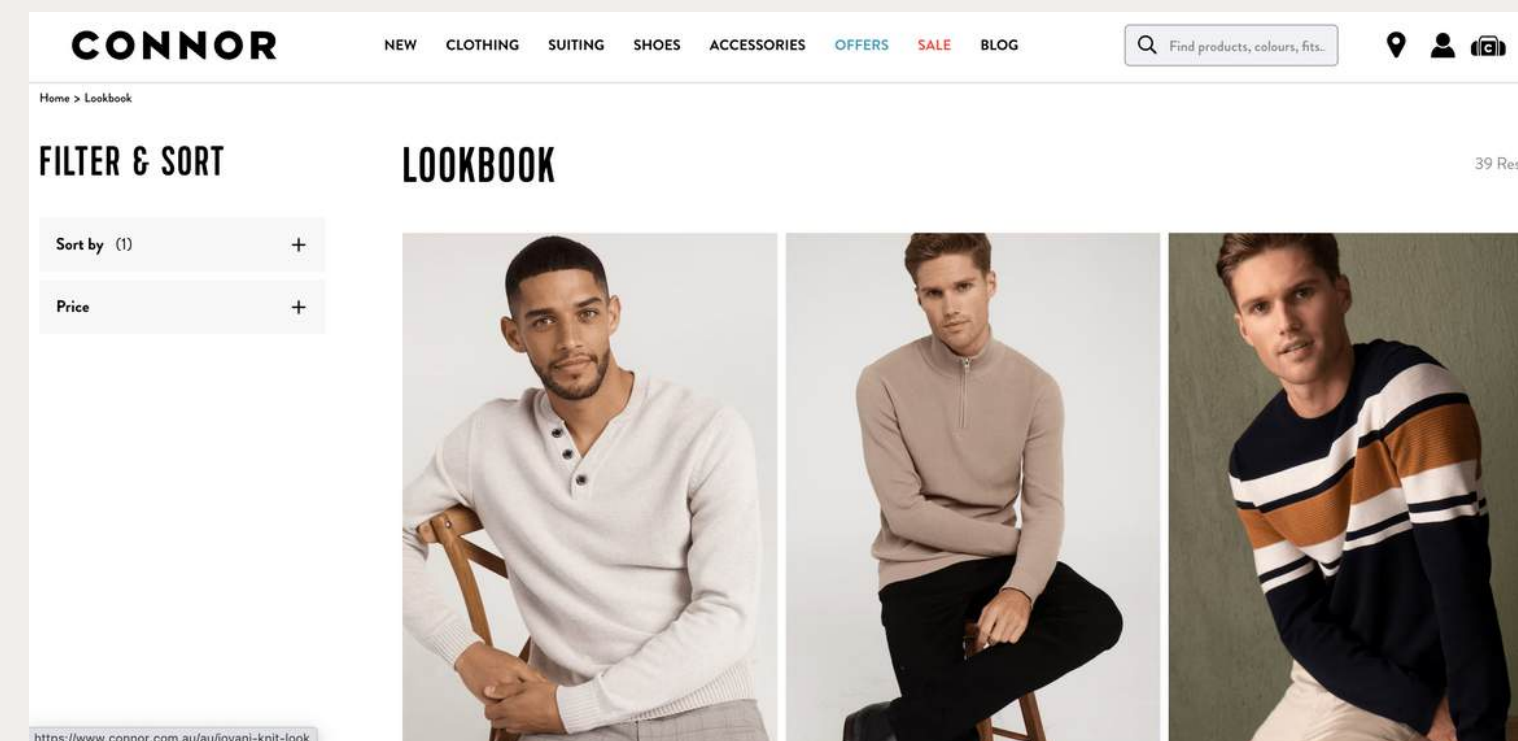

60 sets of men's outfits
40 sets of women's outfits

*Each outfit set consists of the
at least 3 mandatory parts which are
top, bottom, and shoes*

*and some outfit sets also include
matching jackets, bags, and other
accessories*

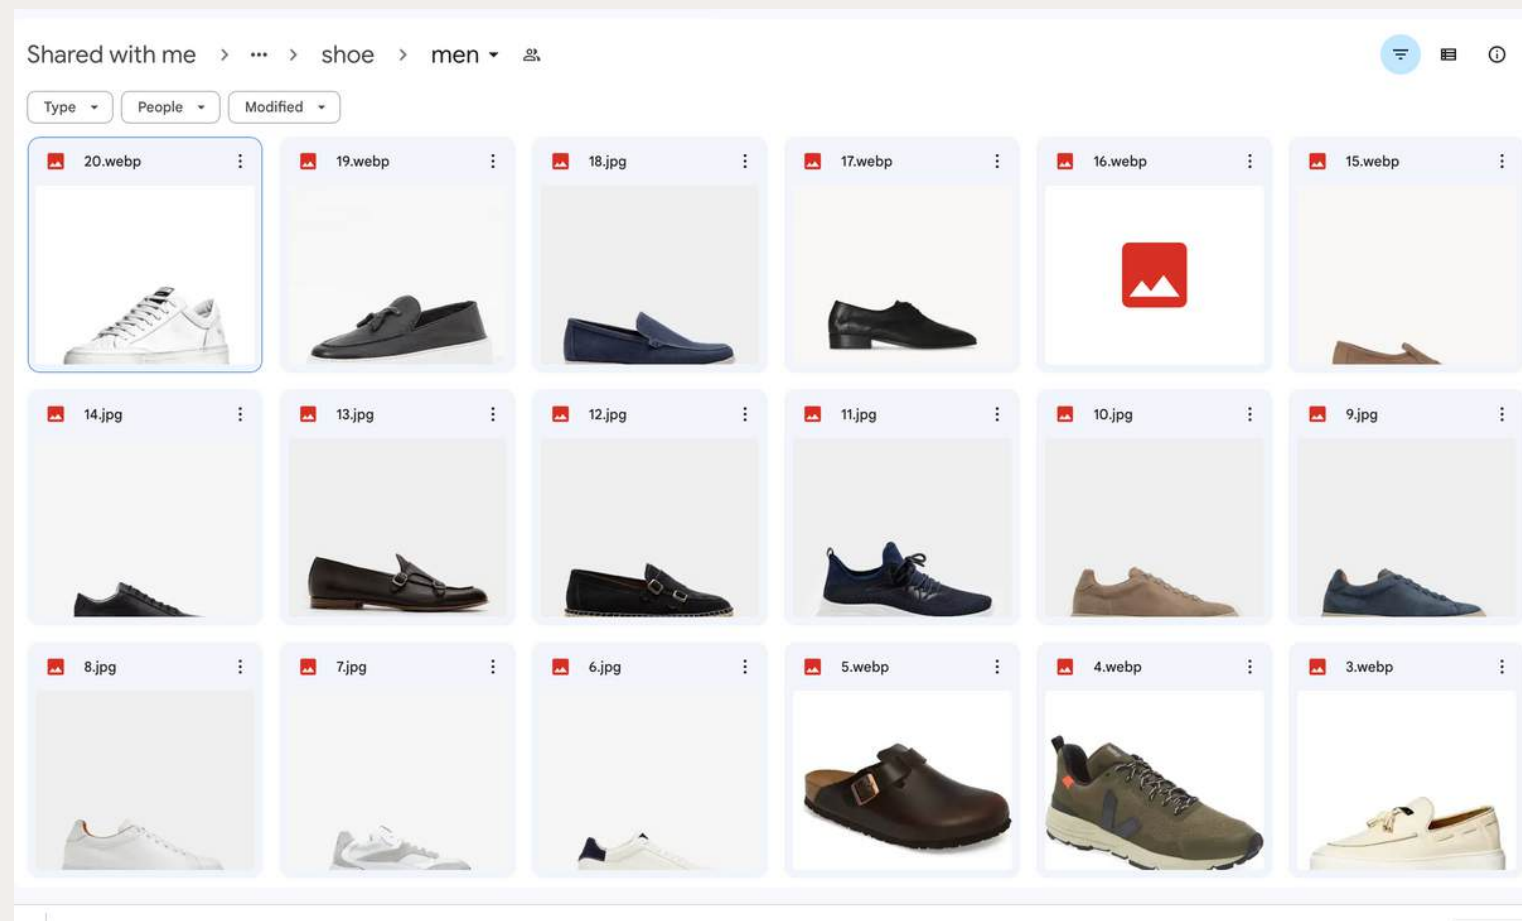

shop by look from real fashion websites

Agenda

FRONTEND DEVELOPMENT

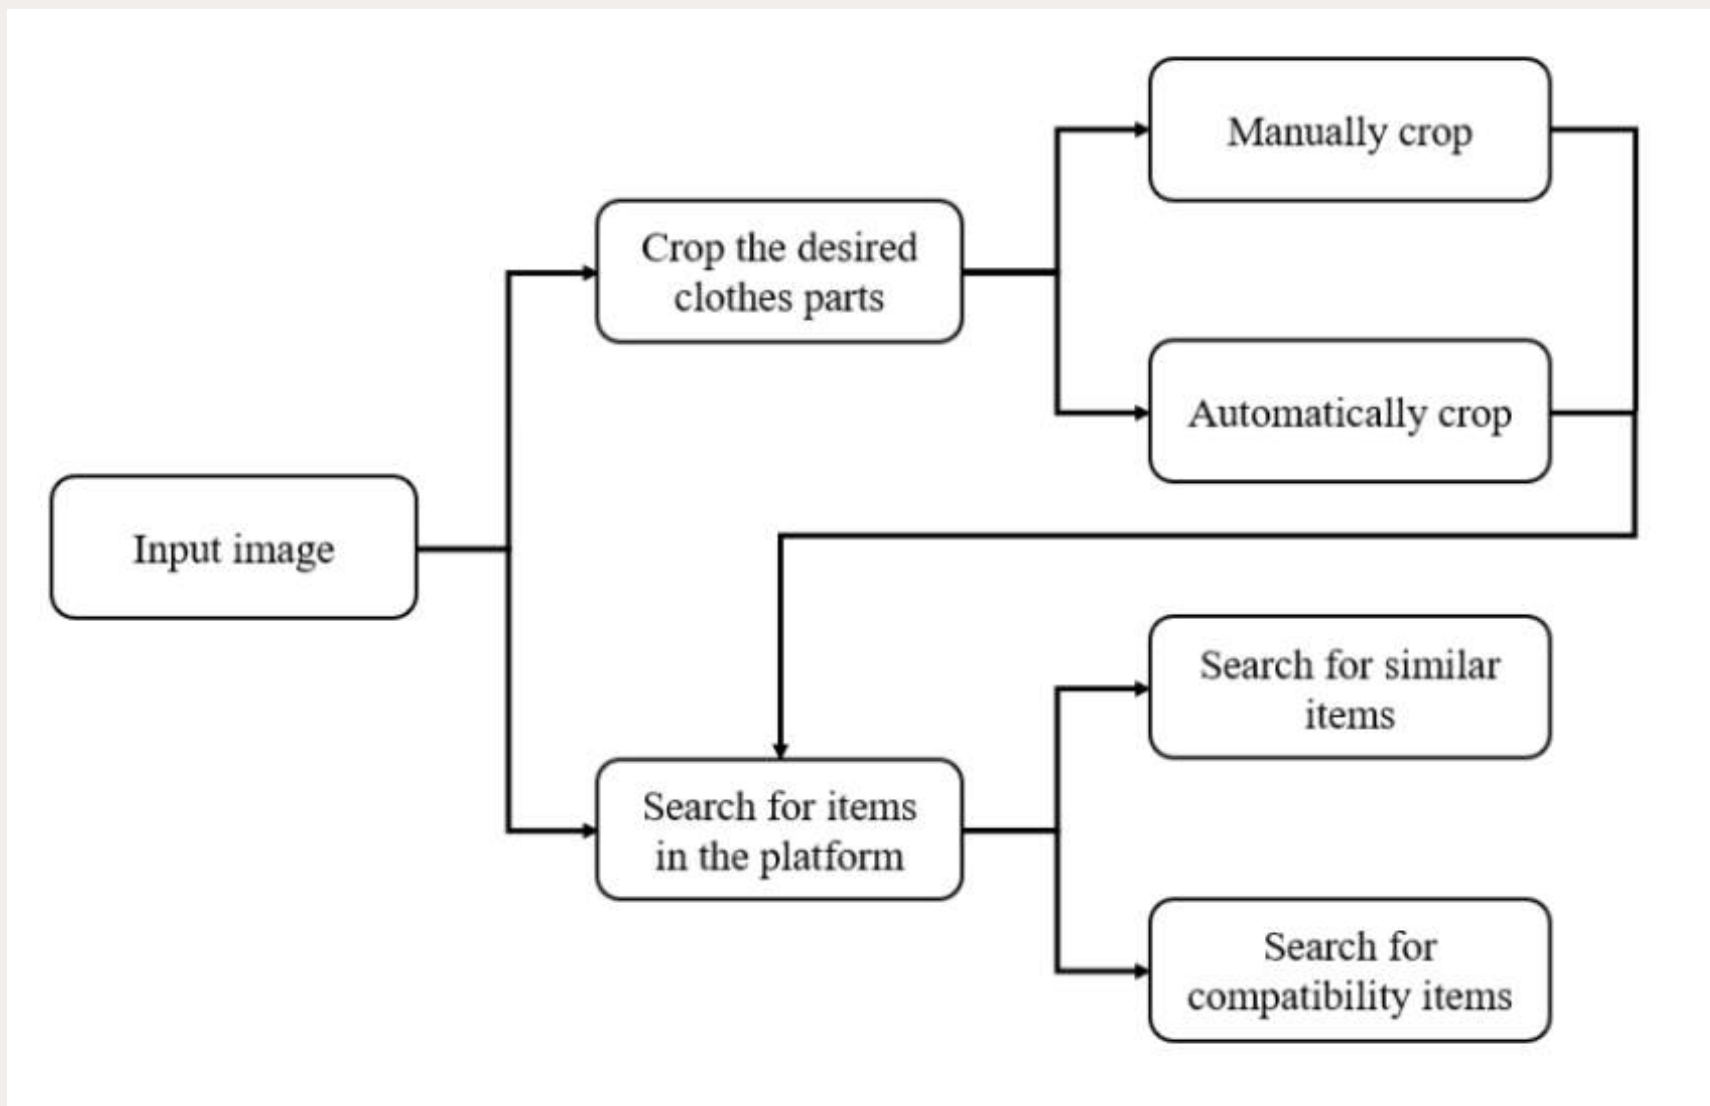

We combine **Web Development Technologies**

- HTML5
- CSS3
- JavaScript

Example of frontend from the website

BACKEND DEVELOPMENT

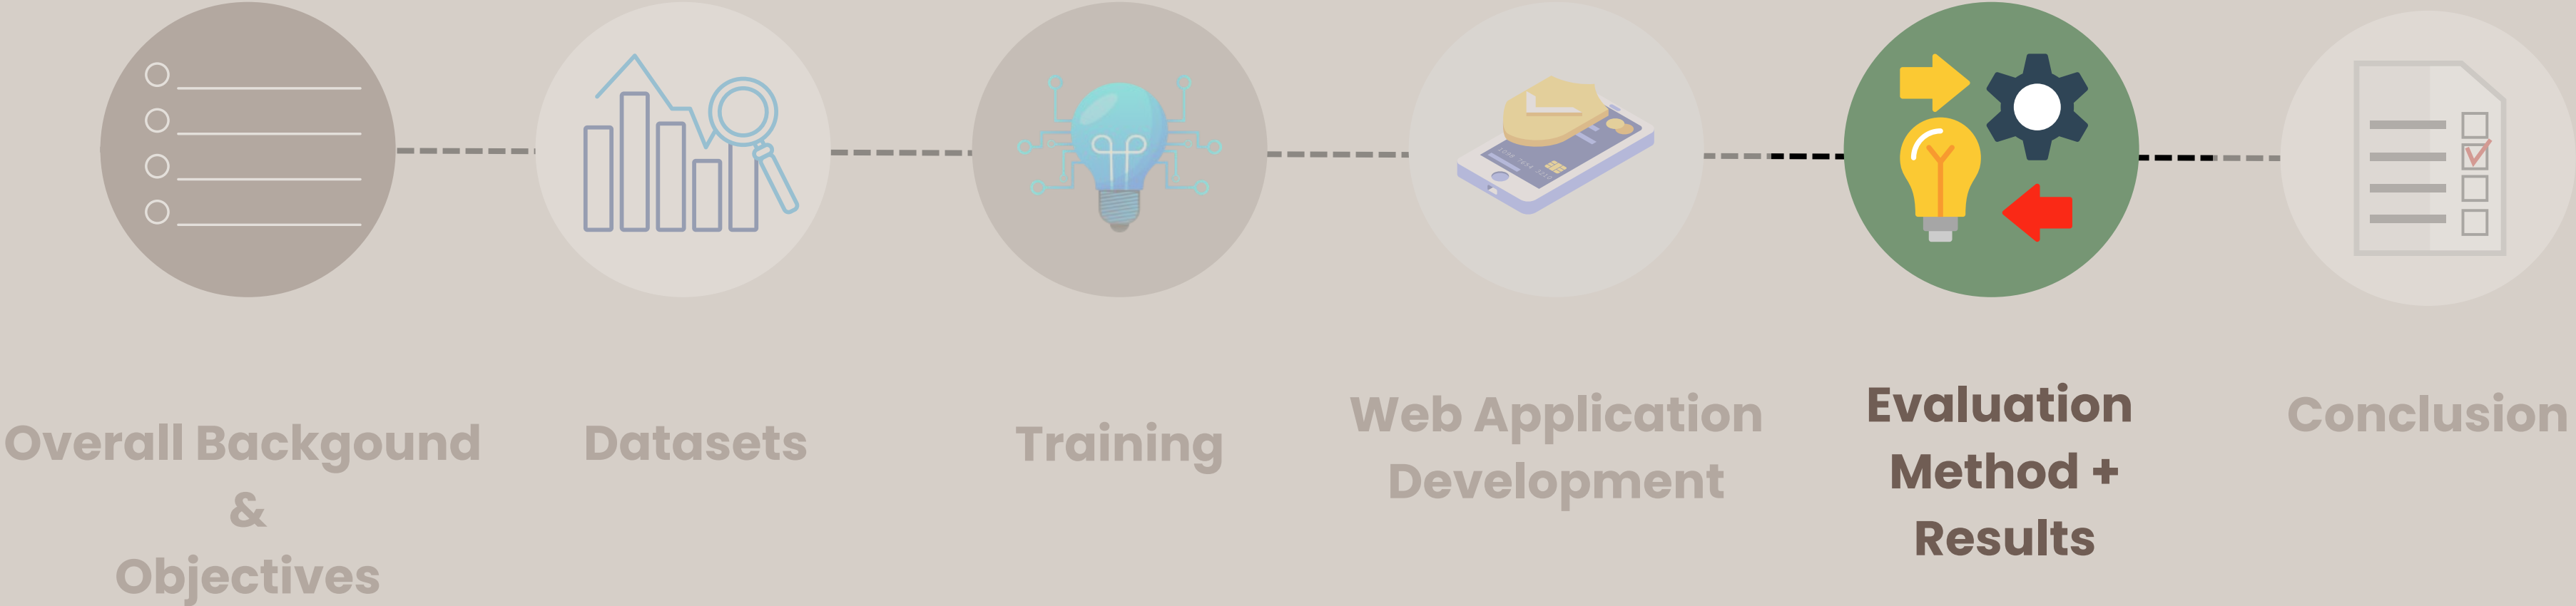

workflow of flask application

We use **Flask Web application** to combine our

- Python application
- Similarity search model
- Compatibility search model
- YOLO object recognition model

Flask allows people to use our models

Agenda

EVALUATION METHODS

Compatibility score

1ST KPI

Outfit similarity score

2ND KPI

Review by survey

3 RD KPI

COMPATIBILITY SCORE

measures how many predicted compatible items are corrected

Evaluate with:

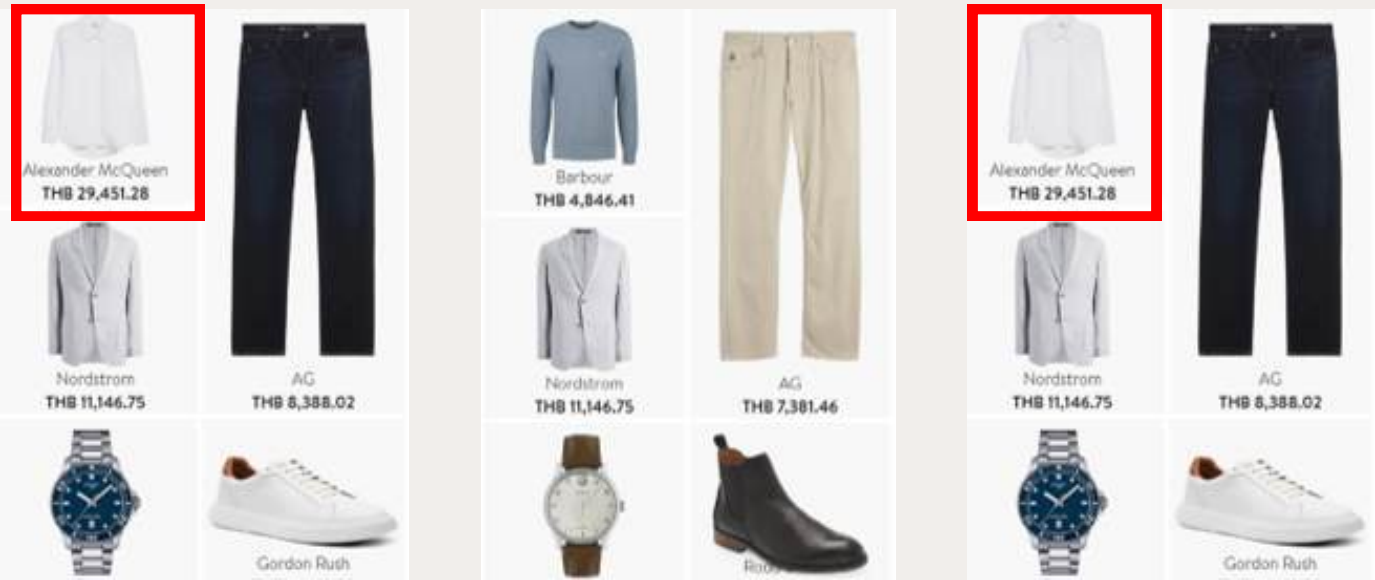

Training dataset

Testing dataset

COMPATIBILITY SCORE

Labeled compatible outfit

Predicted compatible outfit

Compatibility score = $\frac{\text{No. of items found in labeled outfit}}{\text{Total predicted items}}$

Input image

Evaluated dataset	Compatibility score
Testing dataset	0.2238

END 1st KPI
RESULT

OUTFIT SIMILARITY SCORE

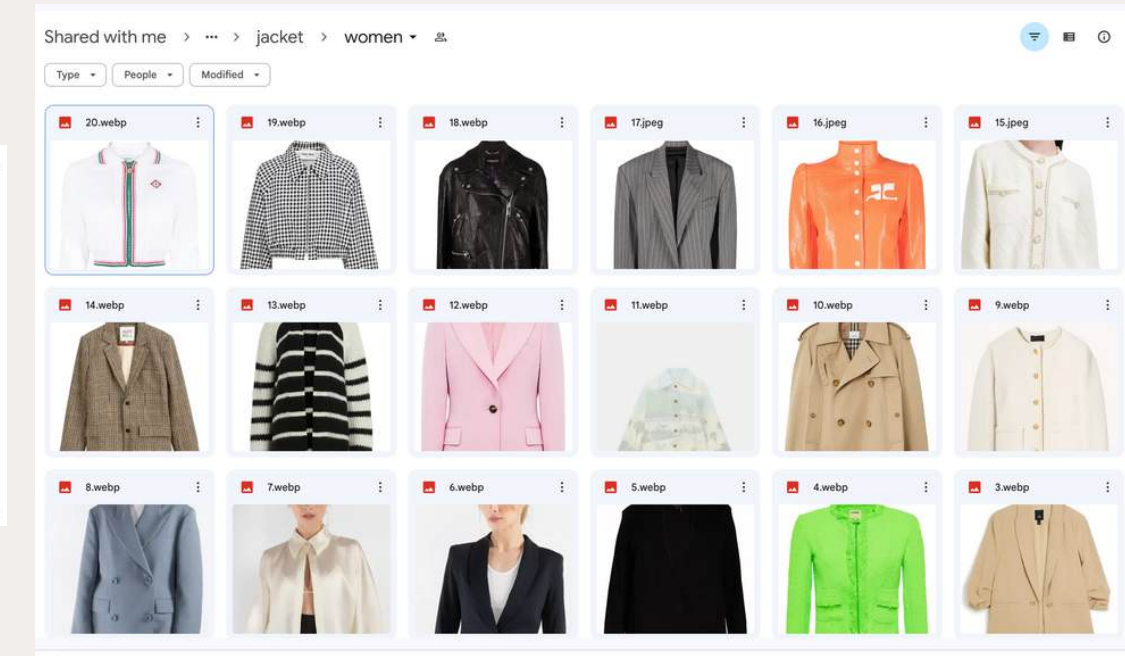

measures how similar the predicted items are compared to the items in same category in the dataset using cosine similarity

Evaluate with:

Training dataset

Testing dataset

Our platform item's dataset

OUTFIT SIMILARITY SCORE

Labeled outfit

Input image

Outfit similarity score for each query example

$$= \frac{\text{Total outfit similarity score from each predicted items}}{\text{Total predicted item}}$$

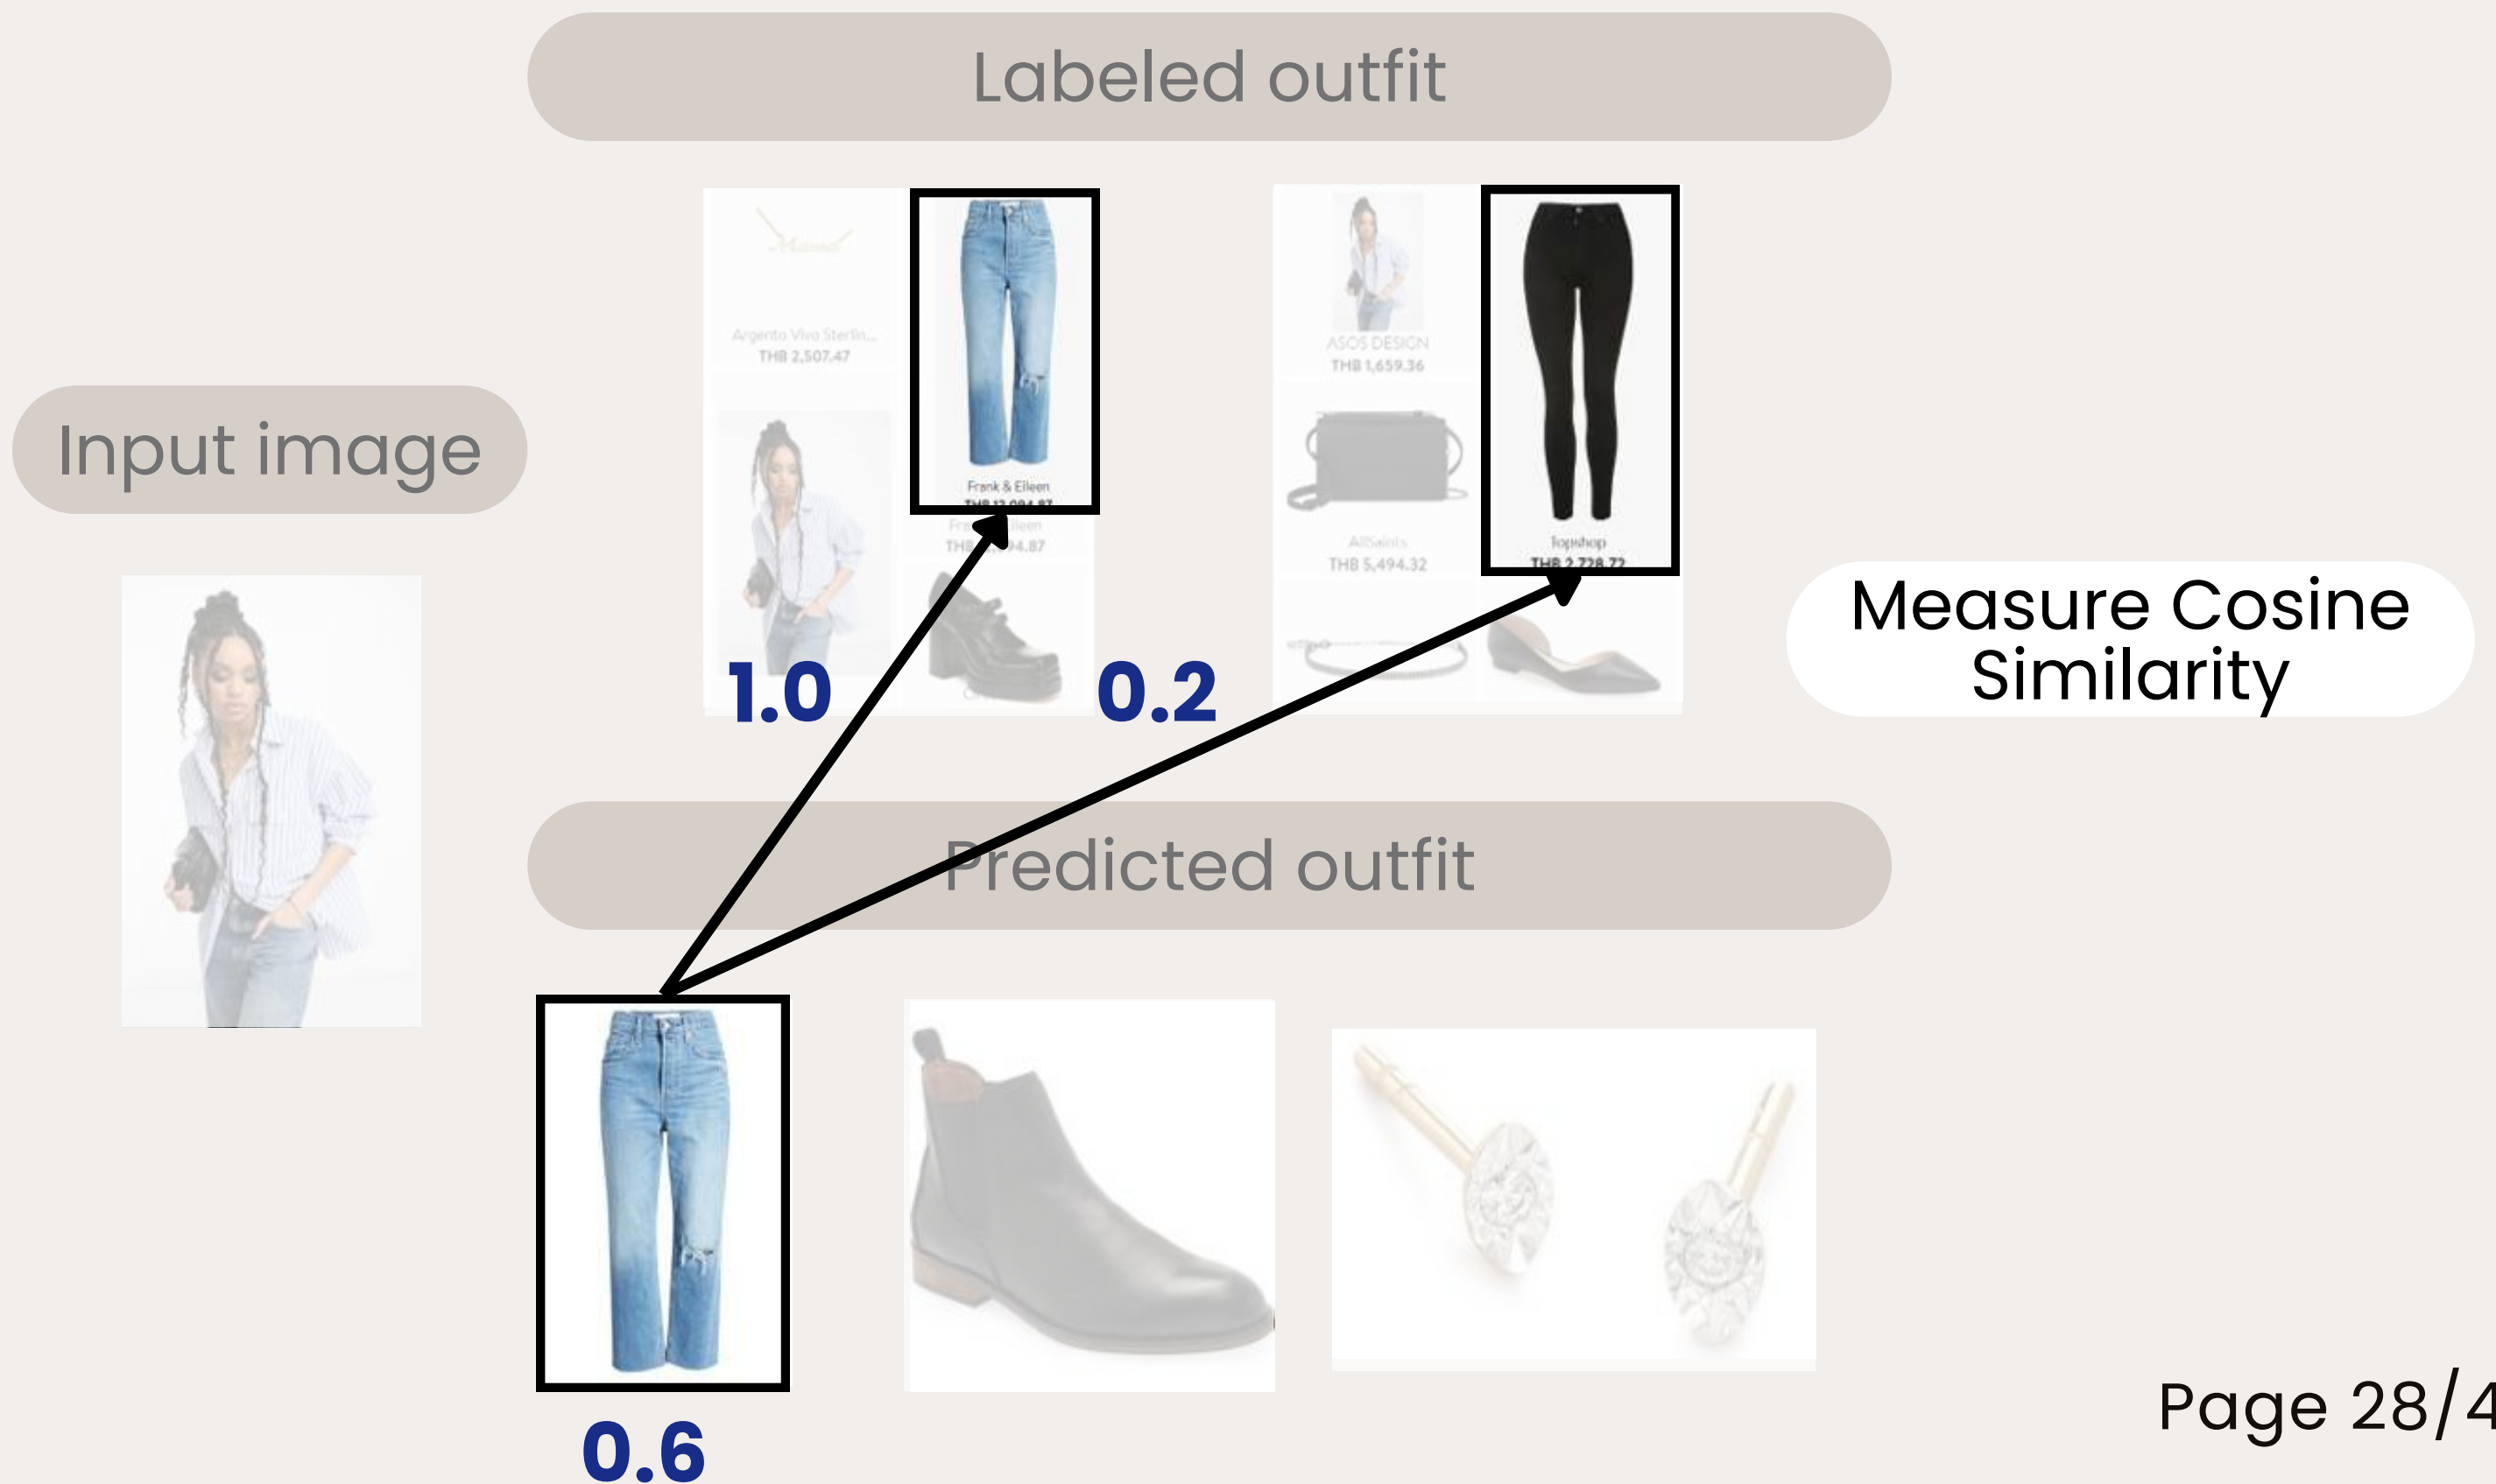

Predicted outfit

Outfit similarity score for each predicted item

$$= \text{Average Cosine similarity between item in labeled outfit \& predicted outfit in same category}$$
